                                                                                                                                                                                                                                                                    DЬ
                                                                                                                                                                                                                                                                                               δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the GR genes, their use in the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are CR Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella CR invention is also useful for the identification of potential new targets CR for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. CR and to obtain antibodies capable of binding to the expressed proteins. CR programmes. The antisense nucleic acid sequence for homologous nucleic acids which are required for cell protein success the expressed proteins. CR wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

CR Note: The sequence data for this patent did not form part CR of the printed specification, but was obtained in electronic format directly from WIPO at

      transketolase family. The tata protein is essential for the growth of candyor survival of p. aeruginosa or any organism that may possess it. This is shown in particular by a temperature sensitive (ts) mutant ts-92 (AAUU0426) which has an amino acid substitution of Arg to His at residue 204. The tata polypeptides are useful as antimicrobial CC particularly antibacterial compounds and identifying membrane bound or consider the tata polypeptides and polynucleotides are useful for CC club and the tata polypeptides and polynucleotides are useful for CC diagnosing or prognosing a disease or susceptibility to a disease in a chuman (e.g. bacterial infection) and for assessing the binding of small CC molecule substrates and ligands in cells and chemical libraries. Diseases CC caused by P. aeruginosa are difficult to treat because of antibiotic cresistance and untreatable strains often found in patients with chronic CC lung infections e.g. cystic fibrosis. The agonists and antagonists to the tata polypeptides and/or polynucleotides are useful for treating contents of the tata polypeptides and polynucleotides are useful for treating contents of the convertibility of liquilitis and uninary tract and wound infections, cities, felliculatis, folliculatis, reducing the risk of H. pylori-induced concers such as gastrointestinal carcinoma and also preventing/treating constraints and antagonists and antagonists unincome and assortitis of the content of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ij

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC the present sequence encodes for Pseudomonas aeruginosa transketolase CC tkth mutant ts-92 protein. A novel P. aeruginosa tkth protein which is CC the growth and/or survival of P. aeruginosa of any organism that may CC (the growth and/or survival of P. aeruginosa or any organism that may CC (ts) mutant ts-92 (AAU00426) which has an amino acid substitution of Arg CC particularly antibacterial compounds and identifying membrane bound or CC particularly antibacterial compounds and identifying membrane bound or CC reagents. Both the tkth polypeptides can be used as diagnostic CC diagnosing or prognosing a disease or susceptibility to a disease in a cC molecule substrates and ligands in cells and chemical libraries. Diseases CC consistence and untreatable strains often found in pattents with chronic CC lung infections e.g. cystic fibrosis. The agonists and antagonists to conscious infections e.g. cystic fibrosis. The agonists and antagonists to concers such as gastrointestinal carcinoma and also preventing/treating CC cancers such as gastrointestinal carcinoma and also preventing/treating CC cancers such as gastrointestinal carcinoma and also preventing/treating CC concers such as gastrointestinal carcinoma and also preventing/treating the wild type sequence is not given in the patent but is indexed from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               11339
                                                                               The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nakagawa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                            Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    metabolism and oxidative phosphorylation (SMP) proteins given in CC AAB79243 to AAB 79633 which are involved in carbon metabolism and CC energy production. The C. glutanicum SMP gene can be used in vectors (II) for expression in host cells and production or medulation of CC production of fine chemicals, such as an organic acid, a proteinogenic or nonproteinogenic amino acid (preferred), a purine or pyrimidine base, a nucleoside, a nucleotide, a lipid, a saturated or unsaturated fatty acid, a diol, a carbohydrate, an aromatic compound, a vitamin, a compreted, a polyketide, or an enzyme. The presence of (I) or SMP proteins (III) encoded by them are used for diagnosing the presence or activity of CC containing them are used for diagnosing the presence or activity of CC containing them are used to map genomes of organisms related to containing them are used to map genomes of organisms related to containing them are used to map genomes of organisms related to containing them are used to map genomes of organisms related to containing them are used to map genomes of organisms related to containing them are used to map genomes of organisms related to containing them are used to map genomes of organisms related to containing them are used to map genomes of organisms related to containing them are used to map genomes of organisms related to containing them are used to map genomes of organisms related to contain of sugars, and in modulating MMP protein regions required company studies, in determining SMP protein regions required to a cell (i.e. ATP, NADPH).
                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                          fermenting L-amino acid-producing coryneform bacteria which overexpresses a gene e.g. that for transketolase, tkt. Also included are transformed coryneform microorganisms harbouring the plasmid pEC-T18mob2 which contains the tkt gene. The method is useful for the fermentative preparation of L-amino acids, i.e. L-lysine, L-threonine and L-isoleucine at least the tkt gene is amplified. L-lysine, L-threonine and L-isoleucine are useful in animal nutrition, in human medicine and in the pharmaceuticals industry. The present sequence is a partial copy of the tkt gene.
        Sequence
                                                                                                                                                                                                                                                                                          The invention relates to the preparation of L-amino acids
                                                                                                                                                                                                                                                                                                                                                Example 2; Page 38-41; 53pp; English

Description

Query Match Best Local Similarity

19.4%; 5.5%;

Score 51.2; DB 6; Pred. No. 0.00053;

Length 7218;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              will be sequenced to completion. In the event that the record is updated, the accession number will

* NOTE: This is a 'working draft' sequence. It currently
* consists of 11 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will

(see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 61 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Consensus quality: 150917 bases at least Q40 Consensus quality: 158026 bases at least Q30 Consensus quality: 164737 bases at least Q30 Estimated insert size: 150665; sum-of-contigs estimation Quality coverage: 0x in Q20 bases; agarose-fp estimation Quality coverage: 2.4x in Q20 bases; sum-of-contigs estimation
